

## The Global Economy

### *Business Cycle Indicators*

## Where we're headed

- Short-term economic performance
- A series of topics
- On today's agenda
  - Indicators
  - Big inflations

2

## The question

- How does the US economy look to you right now?
- How can you tell?

3

## The idea

- Lots of indicators of economic activity
- We use their past patterns to assess
  - Current economic conditions
  - Near-term future economic conditions
- If (say) an increase in housing starts has been associated with good economic performance in the past ...
- What if this time is different?

4

## Joke of the day

- Why do economists add a digit after the decimal point to their forecasts?
- To show they have a sense of humor

5

## Bonus joke of the day

- "Nation's Unemployment Outlook Improves Drastically After Fifth Beer," The Onion.

6

## Forecasting

- John Maynard Keynes
  - You don't expect dentists to be able to forecast how many teeth you'll have when you're 80. You expect them to give good advice and fix problems.

7

## Courses related to this topic

- Real-world analysis of economic data (ECON-GB.2347)
  - Professor Peter D'Antonio, Citi, Director and Head of US Economic Forecasting, does this for a living
- Forecasting time series data (STAT-GB.0018)
  - Professor Cliff Hurvich, expert and pianist
  - Or Professor Rohit Deo, also an expert

8

## What's happening?

- Employment report comes out Friday at 8:30am
  - Consensus: up 240k in October
  - September: up 248k
  - Unemployment rate: consensus 5.9 (same as Sep)
  - More on Bloomberg calendar, FRED
- What do we learn from this?
- How will markets respond?

9

## Roadmap

- Indicators
- The cross-correlation function
- The business cycle scorecard

10

## *Indicators*

## Indicators of economic activity

- Hundreds of them, more all the time
- See Bloomberg calendar (ditto WSJ, others)

12

## Indicators: terminology

- A variable is **procyclical** if it moves up and down with the economy, **countercyclical** if it moves in the opposite direction
- A variable **leads** the economy if its ups and downs come before, **lags** if its movements come after, **coincident** if they happen at the same time
- “The economy” = GDP growth

13

## Indicators: plan

- Look at monthly data (mostly yoy growth rates)
- Shift from GDP to industrial production
- For each one
  - Is it procyclical? Countercyclical?
  - Does it lead? Lag?
  - What does it suggest about current and future conditions?

14

## Indicators: FRED

- Plot and download data

15

## Industrial production (yoy growth)

16

## Industrial production and GDP (yoy)

17

## Housing starts (units, thousands)

18

## Housing starts (yoy growth)

19

## Retail sales (yoy growth)

20

## Consumer sentiment (index)

21

## Employment (yoy growth)

22

## Unemployment rate

23

## Initial claims for UI

24

## Commercial & industrial loans (yoy growth)

25

## S&P 500 (yoy growth)

26

## Term spread (10y - fed funds)

27

## Indicator summary

- Think about which indicators are
  - Procyclical
  - Countercyclical
  - Leading
  - Lagging
  - Coincident
- Which ones do you like best?

28

## Cross-correlations

## Cross-correlation function

- A graphical tool for identifying leads and lags
- Also pro- and countercyclical

30

## Review: correlations

- Correlations: a measure of (linear) association between two variables
- Conveniently scaled between -1 and +1
- The farther from zero, the stronger the association
- Link to nontechnical guide on Course Outline

31

## Review: correlations

32

## The cross-correlation function

- Look at the correlation between  $x$  and  $y$
- Think of  $y$  as economic growth,  $x$  as the indicator
- Shift  $y$  back and forth in time (to see leads and lags)**
- Formally

$$\text{ccf}(k) = \text{corr}[x(t), y(t-k)]$$

- If  $k < 0$ :  $x$  leads  $y$  [or  $y$  lags  $x$ ]
- If  $k > 0$ :  $x$  lags  $y$  [or  $y$  leads  $x$ ]

33

## Contemporaneous correlation

| Date | $x(t)$ | $y(t)$ |
|------|--------|--------|
| 1    | 2.43   | 8.47   |
| 2    | 1.19   | 2.29   |
| 3    | 0.13   | 7.36   |
| 4    | 0.56   | 6.39   |
| 5    | 0.38   | 6.02   |
| 6    | 0.96   | 0.22   |
| 7    | 1.87   | 3.60   |

Reminder:

- $\text{ccf}(k) = \text{corr}[x(t), y(t-k)]$

For  $k = 0$ :

- $\text{ccf}(0) = \text{corr}[x(t), y(t)]$

Use data marked

- Red for  $x$
- Blue for  $y$

34

## Lagging correlation

| Date | $x(t)$ | $y(t-1)$ |
|------|--------|----------|
| 1    | 2.43   | 8.47     |
| 2    | 1.19   | 2.29     |
| 3    | 0.13   | 7.36     |
| 4    | 0.56   | 6.39     |
| 5    | 0.38   | 6.02     |
| 6    | 0.96   | 0.22     |
| 7    | 1.87   | 3.60     |

Reminder:

- $\text{ccf}(k) = \text{corr}[x(t), y(t-k)]$

For  $k = +1$ :

- $\text{ccf}(1) = \text{corr}[x(t), y(t-1)]$
- Means:  $x$  lags  $y$

Use data marked

- Red for  $x$
- Blue for  $y$
- Note lost observation

35

## Leading correlation

| Date | $x(t)$ | $y(t+1)$ |
|------|--------|----------|
| 1    | 2.43   | 8.47     |
| 2    | 1.19   | 2.29     |
| 3    | 0.13   | 7.36     |
| 4    | 0.56   | 6.39     |
| 5    | 0.38   | 6.02     |
| 6    | 0.96   | 0.22     |
| 7    | 1.87   | 3.60     |

Reminder:

- $\text{ccf}(k) = \text{corr}[x(t), y(t-k)]$

For  $k = -1$ :

- $\text{ccf}(1) = \text{corr}[x(t), y(t+1)]$
- Means:  $x$  leads  $y$

Use data marked

- Red for  $x$
- Blue for  $y$
- Note lost observation

36

## Cross correlation graphs

- Pictures: plot  $c_{cf}(k)$  against  $k$ 
  - $y$  = IP growth
  - $x$  = indicator
- Sample period: 1960 to present [why?]
- Most variables are yoy growth rates [why?]
- Does indicator lead or lag IP growth?

37

## Does employment lead or lag?

38

## How to tell

- Find the largest correlation
- Procyclical or countercyclical?
  - If positive, procyclical
  - If negative, countercyclical
- Leading or lagging
  - If to the left, leading
  - If to the right, lagging

39

## Initial ("new") claims for UI (yoy growth)

40

## Housing starts (yoy growth)

41

## Consumer sentiment (yoy growth)

42

## S&P 500 (yoy growth)

43

## Yield spread

44

## Good indicators

- Which ones have high correlations?
- Which ones lead?
- Which ones do you like best?
- Warning: even the best indicators forecast the future imperfectly [poorly?]

45

## Computing cross-correlations

- How do we compute them?
  - Method 1: use Excel to calculate each point [see link]
  - Method 2: use some kind of statistical software [R? Python?]

46

## *Business cycle scorecard*

## Business cycle scorecard

- We often find indicators pointing in different directions
- Therefore: summarize them somehow
- For each indicator:
  - Graph indicator over time
  - Add lines for mean, +/- one std deviation
  - Rate indicator as strong positive, positive, negative, strong negative
- Scorecard: track total overall tendencies

48

## Business cycle scorecard

49

## Business cycle scorecard

50

## Business cycle scorecard

| Indicator    | Strong Negative | Negative | Positive | Strong Positive |
|--------------|-----------------|----------|----------|-----------------|
| Ind. Prod.   |                 |          |          |                 |
|              |                 |          |          |                 |
|              |                 |          |          |                 |
| <b>Total</b> |                 |          |          |                 |

51

## Business cycle scorecard

- Coming up: Problem Set #3 due next week
  - Download indicators from FRED
  - Compute cross-correlation functions
  - Construct business cycle scorecard
  - Start soon!

52

## Scorecard: my goal

Source: Macroblogger, April 2013.

53

## What have we learned?

- Lots of things move up and down with the economy
- We can use these patterns to assess current and near-term future conditions
- Useful tools
  - Cross-correlation function
  - Business cycle scorecard
- Where can I learn more?
  - Indicators course: ECON-GB.2347, D'Antonio
  - Forecasting course: STAT-GB.0018, Deo and Hurvich

54

## Midterm

- Answers posted
- Grade distribution
  - Maximum: 103 (out of 110)
  - 80th percentile: 97
  - 65th: 93
  - 50th: 87
  - 25th: 80

55

## The Global Economy

### *Hyperinflation*

NYU  STERN

## The Global Economy

### *Inflation and Monetary Policy*

 NYU | STERN

## Terminology

- The **price level** is a measure of average prices
  - We label it P
  - Measured in units of currency (how many dollars it takes to buy some collection of goods)
- **Inflation** is the rate of growth of the price level
  - Buying goods takes more currency
  - Or: a unit of currency buys less (same thing, of course)
- We call it **deflation** if growth rate is negative
- **Hyperinflation** is inflation > 100% per year

58

## The idea

- Study inflation by looking at extreme cases
- [Like studying the flu via ebola?]

59

## The idea

- Tom Sargent, interview
  - The way to start a hyperinflation is run sustained government deficits and then have the monetary authority print money to pay for it. That always works. How do you stop a hyperinflation? You stop doing it. This isn't high economic theory.
- What is he saying? Does it make sense to you?

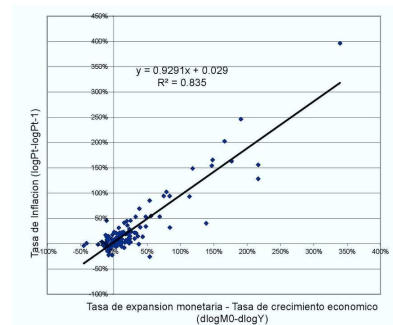

60

## The idea

- La Nacion, via Google translate, March 25, 2012
  - [Argentina's] Central Bank president, Mercedes Marco del Pont, said it "is totally false to say that the issue [of money] generates inflation." She continued: "only in Argentina does the idea remain that the expansion of the money [supply] generates inflation."
- What is she saying? Does it make sense to you?

61

## The idea: Argentine data

Source: Foco Economico, March 2012.

62

## Roadmap

- Terminology
- Hyperinflation show and tell
- Money and inflation: the quantity theory
- Money supply mechanics
- How deficits enter the picture

63

## Hyperinflation show and tell

## German currency

October 1923: 20 USD = 1 billion RM

65

## Argentine currency

This note dates from 1980s. What's it worth now?

66

## Turkish currencies

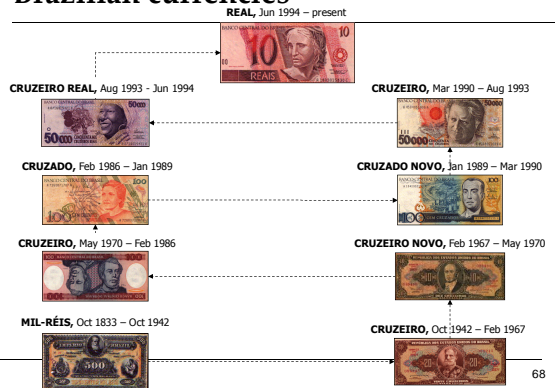

After 2008

Before 2008

67

## Brazilian currencies

68

## Highest inflation rates ever

| Example              | Highest Daily Inflation |
|----------------------|-------------------------|
| Hungary, Jul 1946    | 207%                    |
| Zimbabwe, Nov 2008   | 98%                     |
| Yugoslavia, Jan 1994 | 65%                     |
| Germany, Oct 1923    | 21%                     |

69

## Inflation in Argentina (annual %)

Source: EIU database.

70

## Inflation in Brazil (annual %)

Source: EIU database.

71

## Inflation in Russia (annual %)

Source: EIU database.

72

## Inflation in Turkey (annual %)

Source: EIU database.

73

## Buying lunch in Zimbabwe

| 2                         | Castle    |                  |                 |     |   |
|                           | @         | 2495,6           | 2491,270,000.00 |     |   |
| 1                         | Min Water | 2495,635,000.00  |                 |     |   |
| 1                         | Dinner B  | 24956,350,000.00 |                 |     |   |
| Food 24956,350,000.00     |           |                  |                 |     |   |
| Beverage 24256,955,000.00 |           |                  |                 |     |   |
| 261,243,225,000.00        |           |                  |                 |     |   |
| Z\$ 1,243,255,000.00      |           |                  |                 |     |   |
| 00                        |           |                  |                 |     |   |

74

## Zimbabwe timeline

- December 2006: inflation over 1000%
- February 2007: inflation ruled illegal
- October 2008: inflation over 200 million percent!
- January 2009:
  - Transactions permitted in foreign currency
  - Soldiers and teachers to be paid in USD
- February 2009: 12 zeros knocked off
- April 2009: government abandons currency, people use USD (also South African rand – ZAR)

75

## Zimbabwe timeline

- Long sad history...

76

## Inflation in Israel (annual %)

Source: EIU database.

77

## Israel in the 1980s

- American Rabbi visiting Israel:
  - During Israel's hyperinflation, I had a mortgage at a 5% fixed annual interest rate. As inflation increased, fixed rate mortgage payments became laughably easy to make, because salaries more or less kept pace with inflation. Finally, I received a notice canceling my mortgage, because the cost of record-keeping had become more than the monthly payment.

78

## Iran

- Graeme Wood, "Hyperinflation vacation," The Atlantic, April 2013:
  - The Iranian rial was hovering under 40,000 to one U.S. dollar, weaker by nearly half compared with six months earlier. Authorities tried to ban currency trading for a few weeks in October, when the inflation rate peaked.
  - Wood's First Rule of Budget Travel: where there is runaway inflation, there are great deals for travelers with hard cash. So in January, I boarded a flight from Dubai to Kish, an Iranian holiday resort in the Persian Gulf.

79

## Other examples

- Personal experiences with hyperinflation?

80

## *The quantity theory of money*

## Quantity theory: picture

82

## Quantity theory: words

- The more currency (money) in circulation, the less each unit is worth

83

## Quantity theory: math

- One equation (a production function for transactions)

$$M V = P Y$$

- M = stock of money in circulation (amount of currency)
- V = velocity (how often a unit of currency is used in a year)
- P = price level (the GDP deflator or other price index)
- Y = real GDP

84

## Quantity theory: math

- One equation (technology for transactions)

$$M V = P Y$$

- In growth rates

$$\gamma_M + \gamma_V = \gamma_P + \gamma_Y$$

- $\gamma_M$  = growth of money supply (think: currency)
- $\gamma_V$  = growth of velocity
- $\gamma_P$  = growth of price level (the inflation rate)
- $\gamma_Y$  = growth of real GDP

85

## Quantity theory

- Two hypotheses

- $V$  is constant ( $\gamma_V = 0$ )
- $Y$  not affected by changes in  $M$   
[Or: changes in  $Y$  small relative to changes in  $M$ ]

- One conclusion

- Money growth causes inflation

$$\gamma_P = \gamma_M - \gamma_Y$$

86

## Quantity theory: long-run evidence

87

## Quantity theory: short-run evidence

88

## Quantity theory: small inflations

- Lots of other things relevant in small inflations
- Link between money and prices not as tight
- More on this next week

89

## Money supply mechanics

## Money supply mechanics

- How the central bank manages the money supply
  - Money = currency for our purposes
  - Supply changed by buying/selling bonds in market
- Works through balance sheets for
  - Treasury
  - Central bank
  - Private agents (households and firms)

91

## Money supply mechanics

### Treasury

| Assets | Liabilities |
|--------|-------------|
|        | Bonds 200   |

### Central bank

| Assets  | Liabilities |
|---------|-------------|
| Bonds 0 | Money 0     |

### Households and firms

| Assets    | Liabilities |
|-----------|-------------|
| Money 0   |             |
| Bonds 200 |             |

- Where does treasury debt come from?
- Where does money supply come from?

92

## Money supply mechanics

### Treasury

| Assets | Liabilities |
|--------|-------------|
|        | Bonds 200   |

### Central bank

| Assets   | Liabilities |
|----------|-------------|
| Bonds 20 | Money 20    |

### Households and firms

| Assets    | Liabilities |
|-----------|-------------|
| Money 20  |             |
| Bonds 180 |             |

- How does central bank increase money supply?
- Why do households go along?

93

## Money supply mechanics

### Treasury

| Assets | Liabilities |
|--------|-------------|
|        | Bonds 200   |

### Central bank

| Assets   | Liabilities |
|----------|-------------|
| Bonds 20 | Money 20    |

### Households and firms

| Assets    | Liabilities |
|-----------|-------------|
| Money 20  |             |
| Bonds 180 |             |

- Where do deficits come in?
- Does there need to be a connection with money growth?
- Why so in hyperinflations?

94

## Quantity theory: revised picture

95

## Hyperinflation recap

- Hyperinflations – always! – stem from
  - Lack of fiscal discipline [= government deficit]
  - Accommodation by central bank [= printing money]
- How to end them: “stop doing it”
  - Balance government budget
  - Make central bank independent, prohibit it from buying debt directly from Treasury

96

## Fiscal dominance in the US and EU

- **Fiscal dominance** means
  - Government debt and deficit are so large that the only alternative to explicit default is printing money
- **US/Fed view of the world**
  - Need aggressive monetary policy to recover from crisis
- **EU/ECB view of the world**
  - Need to resist inflation with tight monetary policy
  - US guilty of “soft fiscal dominance”

97

## What have we learned?

- Hyperinflation comes from
  - Large increases in money supply
  - Triggered by government deficits
- Solution: Stop doing it.
- Essential tools
  - Quantity theory
  - Central bank balance sheet

98

## For the ride home

- Would the US be better off with gold?
- Would Argentina be better off using USD?

99

## Problem Set #3

- Due in a week
- Technically demanding, start soon
- Post questions on the Google Group

100
